Población Nacional, Ambos sexos, 18 y más años

Sample size:

1000

Estimated Error:

3,2

Questionnaire:

From 17th February until 5th March, Index-Albania, Tirana, conducted a national survey of public opinion in Albanian territory.

Sample:

The Albanian universe was divided in four regions, Tirana, Center, South and North. All the 36 districts of Albania were included in the sample, using an administrative classification of rural area (village), town, and city. A nationally representative multistage random probability sample of the population aged 18+ was used for this survey. The sample comprised 1000 respondents and the sample design was drawn based on 2001 census results, of the population aged 18 years and over, incorporating characteristics of the surveyed universe per age, gender, education type of settlement, national affiliation and region. Selection of households, in urban and rural areas was executed on random route. In the urban areas was the neighbourhood firstly selected by lottery, and secondly the road, in the same way. In the road was selected each household only in the one side of the street, because the most part of the doors were closed or not open by the people. In rural areas, the villages near the urban centre were selected - if these villages have been not included in a survey, conducted by Index Albania during a period of 6 months. It was difficult and sometimes impossible to travel to every village, selected by lottery, during winter. Selection of a respondent was carried out via "next birthday" selection key.

**Remarks about sampling:**

-Final number of clusters or sampling points: 111 -Sample unit from office sampling: Household

**Survey procedure:**

Entrevista Personal

**Fieldwork:**

Survey procedure was face-to-face interview, 92% in-home of the respondent and the other part out home (about 8% of the respondents interviewed out home were respondents of urban areas). A total of 56 interviewers were employed in the survey 32 of them were males and 24 females. 5 interviewers were between 21-25 years old, 14 persons between 26-30 years old, and 15 persons between 31-40 and 22 interviewers 41+ years old. The 94% of the interviewers were graduated persons. 90% of the interviews were made in the first visit. A training session with the interviewers was carried out . A team of 15 supervisors and 4 persons from the management team have administered supervision and the quality of the questionnaires there were realised 7.2% direct controls, 3.8 % by phone and 3.3% back-check ones.

**Response rate:**

Refusal rate stands at 48.3%. Regions with highest refusal rate were Tirana-19.2%; Shkodra-9.3%, Berati -5.1%, Vlora-3.4%, Elbasani-2.2%, Fieri-1.9%, Korca-1.2%. Some said "have no time", some other "have no electricity", some interviews were conducted in the light of candle and the interview was interrupted when the electricity was recovered because the respondents had works to do. There are a number of refusals because some people do not believe in the person of interviewer.

Sample size:

1282

Estimated Error:

2,8

Questionnaire:

The WVS questionnaire had French and Arabic versions from the WVS in Morocco. Algerian members of the research team translated the questions that were added. The translated questionnaire was not back-translated into English and the translated questionnaire was not pre-tested. Some questions or concepts caused particular problems when the questionnaire was translated because seemed irrelevant or inappropriate. However, we kept the questions because of the strong insistence from WVS committee. There have not been any optional WVS questions and/or items been included, however country-specific questions were included. The country-specific questions were inserted where it was most appropriate in the interview schedule, not at the end or in any single location.

Sample:

The sample was designed to be representative of the entire adult population, i.e. 18 years and older, of your country. The lower age cut-off for the sample was 18 and there was not any upper age cut-off for the sample. The different stages in the sampling procedure were: 10 of 48 provinces (gouvernorats) were purposively selected. They were selected to maximize diversity (and representativeness) with respect to economic situation, ethnic composition, population size,

geographic location, level of urbanization, etc. -Districts (communes) were then selected in each province: (1) the largest commune was selected, and (2) a number of additional communes were selected randomly, the number being determined by the population of the province. -Respondents were selected by quota in each district based on sex and age, with the proportion in each of the four age categories determined by the age distribution of the district as reported in the most 1998 census. Quotas based on sex and ages were used to select respondents at the end point of the sample. In each commune, an equal number of men and women were selected. Age quotas were established with reference to the age distribution of the commune as reported in the most recent (1998) census.

Remarks about sampling:

-The final numbers of clusters or sampling points: 36 districts (communes).

Survey procedure:

Entrevista Personal

Fieldwork:

Interviews were done face to face. Interviewers were paid according to performance. Approximately 50% of the interviews were supervised.

Weighting:

No weighting variable was added.

Questionnaire:

The WVS questionnaire was translated from the English questionnaire by a member of the research team. The translated questionnaire was not back-translated into English; however the translated questionnaire was pre-tested. There have been some optional WVS questions and country-specific questions included since we carried out the fourth wave in early 1999 and we did not want to loose trends we included some items that were asked in the previous wave. Nevertheless, a number of questions were omitted: V145A/B/C/D/E/F and V237 Agreement/disagreement with Television is my most important form of entertainment. The reason was because we did not receive those questions at the moment we launch this wave in Argentina.

Sample:

The sampling method applied was stratified according to criteria and Random Multi- Stage in the selection process of the sampling units. After stratifying the nation geographically and by size of community in order to insure conformity of the sample with the latest available estimates by National Census of the distribution of the adult population, 262 different sampling locations or areas were selected on a random basis. The interviewers had no choice whatsoever concerning the part of the city in which they conduct their interviews. Approximately five interviews were conducted in each such randomly selected sampling point. Interviewers were given maps of the area to which they were assigned, with a starting point indicated; they were required The selection of the final sample unit was

selected according predetermined age and sex quotas. These quotas were established according the distribution of these variables in each locality/ city. The procedures described above, were designed to produce samples approximating the adult civilian population (18 and older) living in private household (that is, excluding those in prisons, hospitals, hotels, religious, and educational institutions and those living on reservations or military bases). Also substitution was permitted. There was a specified direction, interviewers should follow. After a successful interview, the interviewer should leave 4 households and make an interview at the 5Th household. If there was a refusal or it was out of target, they tried in the household immediately after the one selected by the probabilistic sample. Geographical stratification was used: division of the country in Regions and Population density.

**Remarks about sampling:**

-Final number of clusters or sampling points: 262. -Sample unit from office sampling: household.

**Survey procedure:**

Entrevista Personal

**Fieldwork:**

Interviewers were paid according to performance. Approximately 20% of the interviews were supervised. Approximately 20% of the interviews were back-checked.

**Response rate:**

Rate of non response: 25%

**Weighting:**

Yes The data were weighted by size of locality/stratum.

Sample size:

1200

Estimated Error:

2,9

Questionnaire:

The WVS questionnaire was translated into Bosnian and approved by BBSS. The questionnaire was accompanied by show cards and methodological instructions for the Survey. MIB team adjusted language in questionnaire to Bosnian, Croat and Serbian version. Translation/approval and printing of questionnaire and development of sampling plan were performed between 26th November and 30th November 2001.

Sample:

The sample 1200 respondents - was designed to be representative of the entire adult population, i.e. 18 years and older, of your country. The lower age cut-off for the sample was 18 and there was not any upper age cut-off for the sample. In the Federation B&H 10 Cantons and in Republika Srpska 6 regions were covered. The sampling plan was foresaw 800 persons in Federation BiH and 400 in Republika Srpska. The Sampling Plan envisaged interviewing in 16 cantons/regions, ensuring the required ethnic and demographic structure of the sample. Sampling points were local neighbourhoods communities. In the bigger urban centres, streets were used. For selection of respondents the principles "turn right" and call at each fifth home address (starting from the home number 3) were used; in multi-storey buildings - every the fifth floor and every first flat to the right of elevator, respectively. In rural settlements principles "zigzag and every house was used. Selection of respondents in household was on the principal "the nearest birthday" of one of the persons aged 18+.

**Remarks about sampling:**

-Sampling points were local neighbourhoods communities

**Survey procedure:**

Entrevista Personal

**Fieldwork:**

There was no problem on the field. Fieldwork started December 03rd and was scheduled to be finished on 10th December including control by supervisors 12th December. Supervisors were to back-check 10% of all interviews by telephone or visit. Supervisors and interviewers have accumulated considerable previous experience with MIB surveys, so it was not hard to work in accordance with the plan. Each supervisor was given written methodological instructions and sampling plan for the Survey

**Response rate:**

During the interviewing 1712 contacts were established. Refusals totalled 512 or 29,9 %. In addition 23 interviews were break in middle of the interviewing because of the length of interview. By entities: Federation BiH 295 Republika Srpska 217 Total refusals were by nationalities: Bosniaks 211, Croats 84, Serbs 198, Other 19. Reasons for refusals: -Outright refusal at the door.....177 -DR available, but ref. for reasons of privacy, suspicious 90 -DR available, but ref. for political reasons .....26 -DR available, but ref. because of a lack of time .....81 -DR available, but ref. because of illness, death in the family 23 -DR available, but ref. because of the length of the questionnaire 115

Población Nacional, Ambos sexos,18 y más años

Sample size:

1931

Estimated Error:

2,3

Questionnaire:

The WVS questionnaire was translated from the English questionnaire by a specialist translator and a member of the research team. The translated questionnaire was back-translated into English and the translated questionnaire was also pre-tested. It was used the English version for outside Quebec and the French version for Quebec. There have been some country-specific questions included in addition to a series of questions on Canadas relationship with the United States that preceded the demographic items, an item asking respondents Canadian pride was included after v162e.

Sample:

The sample was designed to be representative of the entire adult population, i.e. 18 years and older, of your country. The lower age cut-off for the sample was 18 and there was not any upper age cut-off for the sample. The WVS sample was distributed across all provinces of Canada, with the exception of those in the following:1. The Yukon, Northwest Territories, and Labrador. 2. All Indian Reservations. 3. Households in EAs located in remote areas of the country. The various groups excluded account for about 3% of the people in Canada aged 18 years and older. Regionally, the sample was distributed disproportionately to ensure that samples were adequate for cross-regional comparisons. The sample was distributed across all community sizes, down to and including rural locations. Within each region, the sample was distributed proportionately by community size. A total of six strata were created to organize the distribution of sample by community size. In constructing a

probability sample of this universe, the following conditions are met: 1. Each household in the universe has some known probability of selection. 2. No arbitrary judgment is exercised in determining which households are included, or which individual in each household is interviewed. A total of 1931 households were selected from 313 primary sampling units (EAs) widely spread throughout Canada. The sampling operation was performed at four distinct stages: 1. Determination of the numbers of primary sampling units (EAs) to be selected in each stratum. 2. Selection of EAs. 3. Selection of households. 4. Selection of one individual per household. 1. Selection of Primary Sampling Points. Cumulative EA household counts are computed within each community and the required number of PSUs is systematically selected. A random starts and fixed interval method allows each EA a chance of selection proportionate to the number of households therein. 2. Selection of Households. Households are given an equal chance of selection in each EA. Statistics Canada EA maps are reproduced. Boundaries are clearly marked, start points, skip intervals and travel direction designated. Start points and start households are randomly chosen in each case. 3. Selection of One Individual per Household. The final stage involves the selection of the one individual in each household to be interviewed. The procedure involves listing all individuals 18 years of age and over in each household. The random selection of one respondent is controlled by a selection grid.

#### Remarks about sampling:

#### Survey procedure:

Entrevista Personal

#### Fieldwork:

Control of the WVS field staff was directed from Canadian Facts' head office in Toronto. All field and office supervisory staff reported to the WVS project national field director. The office staff included one field director in the Vancouver office, two in the Montreal office and two in the Toronto office. Additionally, the field staff included 15 regional supervisors. The responsibilities of the national field director included: Briefing and training of all supervisory staff; Regular performance monitoring; Preparation of weekly field status reports; Co-ordination of shipping survey materials; Quality control of all interviewing procedures; Organization of a minimum (10%) head office verification on all fieldwork; Investigation and reporting on all verification problems. The responsibilities of the office and regional field supervisors included: Briefing and training of all interviewers; Performance monitoring of all interviewers; Weekly reporting of field status; Review of completed interviews to ensure that procedures were correctly followed; Continuous liaison with interviewers so that specific problems could be transmitted to the national field director and resolved with minimum delay; Initial verification of at least one interview from each assigned location; A completeness check on all interviews. All supervisory staff were personally briefed by the WVS national field director. Briefings involved a full review of training and monitoring procedures required at the interviewer level. All interviewers were also briefed in person by trained supervisory staff. The training sessions always included the conduct of test interviews. Interviewers were required to conduct a minimum of one test interview among friends or relatives as a means of ensuring complete familiarity with procedures

before commencement of actual fieldwork. All interviewers received a copy of a special WVS training manual prepared by Canadian Facts. The precise written instructions clearly outline all survey requirements, call-back procedures, and questionnaire administration instructions. Call-back procedures were designed to optimize expenditures of field resources for this study. The number of call-backs was initiated at different times of the day and on different days of the week to maximize completion rates. The number of calls made to each selected household varied by community size within region stratum as follows: Number of Personal Attempts 1. Toronto, Montreal, Vancouver 5 2. Quebec City, Ottawa/Hull, Hamilton, Winnipeg, Calgary, Edmonton 4 3. Remaining Communities 100K and over 4 4. Communities 10-100K 3 5. Communities under 10K 2 As a further means of boosting response rates, some additional calls were made to "not-at-homes." Furthermore, after every attempt to gain co-operation, some locations with low completion rates were re-cycled to a special team of interviewers who followed up after a 2 or 3 week hiatus. Completed questionnaires were always reviewed by supervisors prior to their return to head office. Incomplete or improperly conducted interviews were returned to the field for completion by either the same or, if necessary, a different interviewer. Interviewers were required to complete report forms for each assigned location. On-going tallies provided supervisory staff with the information necessary to re-assign work or address particular problems. In Montreal, Ottawa/Hull, Northern New Brunswick and designated areas in Northern Ontario, bilingual interviewers were used. The validation of interviewing by Canadian Facts took place immediately after conduct of field work. Field supervisors were required to verify at least one interview from each assigned location. Upon receipt of each assignment, further reviews were carried out by senior field staff at Canadian Facts' head office in Toronto. A minimum of 1 in 20 interviews was verified from each interviewers work. Approximately 10% of the interviews were supervised and 10% were back-checked.

#### Response rate:

A total of 1,931 personal in-home interviews was completed. Based on total contacts of 4,201, a response rate of 46% percent was achieved. All interviewing for the study was conducted between August 3 and September 24, 2000. The following table presents completion rate results:

- Record Of Calls: (4,201) (100%)	- No One At Home 789 (19 %)	-Household Refusal 884 (21%)	- Selected Respondent Refusal 466 (11%)	- No Adult 18 Years + At Home 40 (1%)	- Language Problem 66 (1%)	- Broke Off Interview 25 (1%)	- Completed Interviews 1931 (46%)

Questionnaire:

As a participating country-team of the World Values Survey (WVS), the Research Center of Contemporary China (RCCC) at Peking University implemented the WVS-China survey in 2001. The target population covers those who are between 18 and 65 of age (born between July 2, 1935 and July 1, 1982), formally registered and actually reside in dwellings within the households in China when the survey is conducted.

Sample:

It is a representative national sample of China containing 40 county/city sample units to collect individual level data of, from a political cultural perspective, the values and attitudes currently held by Chinese citizens. With considerations of representativeness, feasibility, and budgetary constraints, it was decided this project would draw a subsidiary probability sample out of a master sample that RCCC created based on its previous national survey on environmental awareness of the general public in China conducted in 1998. The Environmental Awareness Survey, which was used as a master sample, was a national survey conducted through out the entire country. The target

population was the same as the one defined for this survey. Through the stratification, the proportionally allocated multi-stage PPS (probability proportional to size) technique was employed in order to obtain the self-weighted household samples. There were different stages in the sampling procedure: Counties and county-level cities are taken as primary sampling units (PSUs). Family households are the basic sampling unit. Demographic data at all levels was obtained from The Demographic Data for Chinese Cities and Counties, 1997, published by the State Bureau of Statistics. Nation wide, there were 2,860 county-level units for the first stage sampling (including 1,689 counties, 436 county-level cities, and 735 urban district--with administrative rank equivalent to county--in large cities). The total households were 337,659,447. This was the base for establishing the sampling frames. Some readjustments: Taking into account of cost and accessibility, only the provincial capitals (Lhasa and Urumchi) and their surrounding areas in Tibet and Sinkiang were included in the sampling frame; in other remote western provinces, a few areas that are extremely hard to access were left out as well. After such readjustment the sampling frame then includes 2,708 county-level units, of which the total households are 322,002,173. Compared to the target population, there was a 5.3% reduction (152 units) in the first stage sampling units. However, since the population density in the remote areas of the western provinces is very low, the reduction counts merely 1.4% of the total households in the sampling frame. Geographical administrative divisions of China were regarded as the primary labels of stratification, that is, each province was treated as an independent stratum. Allocation of target sampling units among the sampling stages was designed as following: 135 PSUs out of the first sampling (county-level) units; 2 secondary sampling (township-level) units in each of the PSUs; then 2 third sampling (village-level) units in each of the SSUs; 25 households in each of the third sampling units, on average. Based on the proportional stratification principle, sample allocation to strata was proportional to the size of each stratum, by an equal probability of  $f = .0042\%$ . Within each stratum (province), sample sizes were calculated and allocated proportionally to each of the sampling stages. A self-weighted national sample thus was obtained.

Multi-stage PPS: -The first stage: equidistance PPS was employed to draw the county sample. -The second stage: in each of the chosen county-level units, a sampling frame was created based on the data of townships/ward and size measurement; then the equidistance PPS is employed to choose the township/streets sample. -The third stage: a third sampling frame was obtained from each of the chosen township-level units (neighbourhoods, villages and size measurement), and, again, the equidistance PPS is employed to choose the village/neighbourhood sample. -The fourth stage: in each of the chosen village/neighbourhood units, the official list of households registration was obtained; using the size measurement of this unit and the desired number of households to count the sampling distance, then households were selected according to the sampling interval. Since the household registration also listed all family members of each of the household, respondents were drawn randomly immediately after the household drawing. The WVS-China sample was drawn out of the above described master sample. Some readjustments: Primarily because of the budgetary constrains of the WVS project, six remote provinces in the master sample were excluded. They were: Hainan, Tibet, Gansu, Qinghai, Ningxia, and Sinkiang. These provinces are all with very low population density, and all together they count 5.1% of the total population and 4.6% of total households of the country. After the adjustments, seven of the 139 county-level units of the master

sample were removed. Therefore, the target 40 PSUs were to be drawn out of the remaining 132 units. Sampling Stages: -The first stage: 40 units were drawn from 132 county-level units of the master sample were removed. Therefore, the 40 PSUs were to be drawn out of the remaining 132 units. -The second stage: one unit was chosen randomly out of the 2 original township-level units (SSUs) in each of the 40 selected PSUs. -The third stage: one unit was chosen randomly out of the 2 original village-level units in each of the selected SSUs. -The fourth stage: from each of the chosen village-level units, 35 households were drawn out of the household registration list with equidistance, along with one respondent in each selected household.

#### Remarks about sampling:

-Sample unit from office sampling: Housing

#### Survey procedure:

Entrevista Personal

#### Fieldwork:

The length of the fieldwork was from 18 March 2001 to 25 June, 2001

#### Response rate:

The sample size was determined to be approximately 1,000 -- eligible individuals are to be drawn out of the above defined target population in China. Based on previous experience of response rate, it was decided to increase the target sample to 1,400 in order to reach a satisfied response rate. The final results are summarized as follows: -Target sample size: 1,400 -Sample drawn in the field: 1,385 -Completed, valid interviews: 1,000 -Response rate: 72.2% Summary of Non-Responses Types of Non-Responses (missing cases) % -Be away\not seen for several times: 145-37.7% -Be away for long time\\be on a business trip\\go abroad\\travel:138-35.8% -The interviewer didnt write the reason: 23-6.0% -Rejection: 19-4.9% -Move\\investigation reveals no this person: 15-3.9% -Impediments in body or language\\at variance with qualification: 12-3.1% -Useless: 11-2.9% -Address is nor clear\\cant find the address: 10-2.6% -A vacant house: 6-1.6% -Tenant: 6-1.6% -Total: 385-100%

#### Weighting:

Yes Self weighing household samples

Questionnaire:

The WVS questionnaire was translated from the English questionnaire by a member of the research team. The translated questionnaire was also pre-tested. The questionnaire was administered to 300 individuals. Some questions included caused particular problems: Variable 133-136, Variable 182, Variable 196, and Variable 199. We had to re-phrase some questions to fit the Egyptian situation. All problems were solved consequently. The sample was designed to be representative of the entire adult population, i.e. 18 years and older, of your country. The lower age cut-off for the sample was 16 and there was not any upper age cut-off for the sample.

Sample:

There were different stages in the sampling procedure: First Stage: Stratification of Primary Sampling Units (PSUs) identification of 26 Governorates Second Stage: sample of Census Blocks in each governorate to be included Third Stage: Dividing Sample According to Educational Levels Fourth Stage: Choosing Persons to be interviewed in each household. A random sample of households in each PSUs was first selected. Eligible individuals who were 16 years of age and over with certain educational level were then selected for interviews. Substitution was permitted in case the selected household did not exist for any reason at the specified address, a different household from the same census block was selected. The design provides for at least 4 calls, however. The primary stage of sampling Egyptian households was divided into 26 governorates based on boundaries in the

Egyptian local governance system. Because these governorates are not homogeneous, the 1996 Census divided these governorates into four different areas: -Urban areas include governorates, which are urban as a whole, dominated by trade, industry, and business. This category includes Governorates of Cairo, Alexandria, Port Said, and Suez. In Urban-Rural areas, each governorate has some small towns but most inhabitants live in villages and works in agricultural activities. -Northern urban-rural areas include the northern part of the Nile valley: Domiat, Ismailia, Dakahlia, Sharkia, Kaluobia, Gharbia, Menoufia, Kafr Eill Shsheikh, and Behera. -Southern urban areas include the southern part of the Nile valley governorates: Giza, Bani Sowief, Fayom, Assiout,m Kena, and Aswan. -Border Areas include desert outside the Nile Valley, including North and South Sinai, New Valley, and Matrouh. There were some limitations when the survey was realized. It was the high proportion of housewives who were present at the time of the interview.

**Remarks about sampling:**

-Final numbers of clusters or sapling points: 9 -Sample unit from office sampling: Household

**Survey procedure:**

Entrevista Personal

**Fieldwork:**

The fieldwork was done by Emac Research and Training Centre-Cairo Egypt in Collaboration with Ain Shams University-Department of Sociology-Womens College. The interviewers were paid according to performance. Approximately 25% of the interviews were supervised and 5% were back-checked.

**Remarks about non-response:**

Two hundred fifty questionnaires were rejected after the check-up due to errors as well as illogical answers All these questionnaires were replaced by different households in the same census blocks.

**Weighting:**

No weighting variable was added

Questionnaire:

The questionnaire was translated into ten Indian languages by a specialist translator. A few modifications were undertaken in response categories for the scale answer questions. It was then back-translated to English. For each of the 10 languages the pre test was done on a sample of 5 each. There were several concepts and questions difficult to translate: more specifically v75/ v76/ v103/v175/v208/v212/v229/. These problems were solved by developing new phrases close to the original statement or using it in the context of social reality The sample was designed to be representative of the entire adult population, i.e. 18 years and older, of your country. The lower age cut-off for the sample was 18 and there was not any upper age cut-off for the sample.

Sample:

As part of the India component of the World Values Survey, it was decided to conduct 2000 face-to-face interviews. A rigorous scientific method was employed to generate the target sample for the study. The survey was conducted in 18 states of India, which covered nearly 97 % of the nations population. 40 districts in the country were identified for the purpose of the survey (a little less than 1/10 of the districts in the country: 466 districts as per 1991 census). The 40 districts were spread

across the 18 states, in which the survey was conducted keeping in mind the population of the states, even while ensuring that the survey was conducted in at least one district in each of the sampled states. Within each state, the district/s in which the survey was to be conducted was selected by circular sampling (PPS: Probability Proportion to Size). Once all the 40 districts were selected, the Lok Sabha (Lower House of the Indian Parliament) constituency that covered the district was identified. If the sampled district had more than one Lok Sabha constituency, the one, which had a larger proportion of the districts electorate, was selected. The next stage in the sampling process was the selection of 2 State Assembly (Lower House of the State Legislature) constituencies in each of the sampled 40 Lok Sabha constituencies. Circular Sampling (PPS: Probability Proportion to Size) was once again employed. Thus, 80 Assembly Constituencies in 40 Lok Sabha constituencies (in 40 districts) were selected. Subsequently, a polling booth area in each of the 80 sampled Assembly constituencies was selected by simple circular sampling method. The number of respondents to be interviewed in each state was determined on the basis of the proportion of the states share in the national population. This was equally divided among the polling booth areas that were sampled in a state. The number of respondents in the polling booth area was the same within a state, but varied from state to state. In a polling booth area, the respondents were selected from the electoral rolls (voters list) by circular sampling with a random first number. While drawing up the random list of respondents to be interviewed in every sampled polling booth area, the number of target respondents was increased by nearly 20 %. This was done in view of the fact that the field investigators were required to interview only those respondents whose names were included in the sample list. No replacements or alteration in the list of sampled respondents was permitted. Previous survey experience has shown that it has never been possible for the investigator to interview all those included in the list of sampled respondents. A wide range of factors is responsible for the same. The investigators were told to make every effort to interview all those included in the list of respondents. In the event of the investigator not being able to complete an interview, they were asked to record the reason for the same. Such a rigorous method of sampling was followed in order to obtain as representative a national sample as possible. The analysis of the sample profile clearly indicates that the detailed and objective criteria employed has eminently served its purpose as the sample mirrors the nations social, economic, political, cultural and religious diversity.

#### Remarks about sampling:

-Final numbers of clusters or sampling points: No clusters -Sample unit from office sampling: Named individual

#### Survey procedure:

Entrevista Personal

#### Fieldwork:

The fieldwork was done by the Department of Political Science, Bangalore, India. The survey was conducted in 40 survey areas. For each survey area an investigator was sent and asked to complete a specified number of interviews which were in the 40 to 60 range. All investigators were paid the same amount. Calls were made at different times of day. The investigators were asked to make as

many calls as was permissible in the time they were in the survey area. 10 % of interviews were randomly checked by the State coordinators.

#### Response rate:

The following table presents completion rate results: -Total number of starting names/addresses 2354 -Addresses which could not be traced at all 56 -Addresses established as empty, demolished or containing no private dwellings 39 -Selected respondent too sick/incapacitated to participate 29 - Selected respondent away during survey period 62 -Selected respondent had inadequate understanding of language of survey 27 -No contact at selected address 76 -No contact with selected person 31 -Refusal at selected address 34 -Full productive interviews 2002.

Questionnaire:

The WVS questionnaire was translated from the English questionnaire by a member of the research team. The translated questionnaire was not back-translated into English; however the translated questionnaire was pre-tested: one of surveyors interviewed 10 students, one of surveyors interview 10 ordinary people by random, and one of surveyors interviewed 10 old people randomly. This means 30 people were tested. There have not been any optional WVS questions included, and also country-specific questions were not included. The sample was designed to be representative of the entire adult population, i.e. 18 years and older, of your country. The lower age cut-off for the sample was 18 and there was not any upper age cut-off for the sample.

Sample:

There were some quota controls on the type of individual selected to take part in the survey. The quota controls were in one province, 100 respondents were in cities, and 100 respondents were in rural areas. In the final clusters, we got 32 respondents (16 males and 16 females) for cluster A, 36 respondents (18 males and 18 females) for cluster B, and 32 respondents (16 males and 16 females) for cluster C. Clusters are divided into 3 different levels of ages. There were some limitations in the sample. To some extent, people think the questions are too much.

Remarks about sampling:

-Sample unit from office sampling: Named individual

Survey procedure:

Entrevista Personal

Fieldwork:

Interviews were done face to face. Interviewers were paid according to performance. Approximately 75% of the interviews were supervised. Approximately 90% of the interviews were back-checked.

Remarks about non-response:

There were no selected respondent too sick/incapacitated to participate. Also there were no selected respondent away during the survey period and there were no language problem.

Weighting:

No weighting variable was added.

2600 cases were designed for 30 provinces. For two of them the data could not be gathered and so have been dropped. We have considered the sample by age and sex, and rural/urban distributions. With choosing the block and zones in each part of the places in cities and villages we have clarified the number of the interviews in each family in terms of age and sex and finally ask to fill out the questionnaire.

Remarks about sampling:

After finishing the survey, 2535 questionnaires chosen

Survey procedure:

Entrevista Personal

Fieldwork:

During fieldwork we have had some difficulties. Because in the villages some people could not fill out the questionnaire and they did not know us. Hence, we needed someone else to help us (to support us in the new places).

Remarks about non-response:

65 people in our survey have left the survey during the interview. We are not accounting the people rejecting to be interviewed, because we could replace them with someone else with the same qualities.

**IRAQ 2004**

Geographical scope:

Iraq

Fieldwork Period:

16-11-2004 - 16-12-2004.

Universe:

Población Nacional, Ambos sexos,18 y más años

Sample size:

2325

Estimated Error:

2,1

Questionnaire:

The questionnaire designed to cover the main goal of this survey which is identifying Iraqis values as a part of International value survey research. Many questions designed to cover, also, the current political, social and economical issues facing Iraq these days. After designing the questionnaire, pretest has been done on a pilot sample consist of 70 households living in different places of Baghdad. The finding of this pretest has been considered to modify the draft questionnaire and reaching the final version.

Sample:

For the purpose of this research, population frame was defined as all adult citizens (18 years and more) who lived in Iraqi urban and rural areas. Iraq 1997 census data used as the framework to draw the sample. The sample consists of 2700 respondents in 16 provinces(governorates) out of 18 Iraqi provinces. The number of cases to be included for each governorate was determined by considering :1) each governorates population as a percentage of the overall population,2) the number of cases necessary to make valid regional comparisons, and 3) rural area population as a percentage of the governorate population. Two Iraqi provinces, Mosul and Duhuk, had been excluded from the sample . The bad security situation in Mosul made it very risky to conduct any interview there. Duhuk security authorities prevented the interviewers from working in that province. The interviews proportion of Duhuk allocated to Erbil and Sulaimania, which are Kurdish provinces also, to reserve the Iraqi ethnicity proportions. Mosul share of interviews allocated to other three Sunni provinces and cities (Tikreet,Rumadi and three of Baghdad neighbourhood) to reserve the Iraqi sects representations. A multi-stage probability-based sample was drawn, utilizing residential listings from Iraqs 1997 Population Census(data has been attached). Six sampling stages have been deployed. First, number of interviews has been distributed among census districts (Qada) proportionally. Second, each Qada consist of number of census sub districts called (Nahia) which received its share of interviews

proportionally, also. Nahias, in turn, consist of many blocks. At the third stage, blocks regarded as the primary sampling units (PSU) in the urban areas, with 135 PSUs being selected using probability-proportional-to-size procedures. 20 interviews have been conducted in each block. These 20 interviews were distributed among 4 streets (Zukak according to census wording) in the fourth stage. These streets selected by using simple random method. Because more than seven years have been gone since the date of the census, many variables could happened for the residential list in each street, that's why every interviewer has been asked to draw on a spot map for the households that were located in the street he\she suppose to work in. In the fifth stage, each interviewer select, randomly, 5 households in the street depending on random tables. Finally, within each selected household, one respondent was randomly selected using the last birthday method. Because most old Iraqi citizens doesn't know their exact birthday, a list of random birth days used by every interviewer to replace the birth day of every old citizen who dont know his/her birth day. Due to the inaccuracy of the addresses in the rural areas, interviewers have been trained on how to use simple rules in choosing the household which should be interviewed. Same thing practiced on the urban Kurdistan provinces which did not covered by the 1997 national census. Standard rules have been followed to choose blocks, streets and households. The rule of choosing the respondent is same in all 2700 interviews.

#### Remarks about sampling:

The margin of error was calculated in order to 1) incorporate the clustering effects of multistage sample design, and 2) to provide 95% confidence level. Although the overall margin of error is estimated at  $\pm 2.3\%$  ( $n=2325$ ), the margin of error varies across the 16 governorates included in the sample.

#### Survey procedure:

Entrevista Personal

#### Fieldwork:

All interviews have been completed by 177 interviewers, the numbers of permanent field net of the Independent Institute for Administration and Civil Society Studies in the governorates covered by the poll. They have been engaged on a part time basis and cover regions about which they have the relevant local information and the knowledge on specific culture and mentality of the people in an area.

#### Response rate:

94.5%

#### Remarks about non-response:

The rate of refusals was (5.5%). The higher refusal rate was in Ramadi (10.7%), while the lowest rate was in Najaf and karbala (1.7%).

Questionnaire:

The WVS questionnaire was translated from the English questionnaire by a member of the research team. The questionnaire was translated to Hebrew and Arabic. The translated questionnaire was back-translated into English and the translated questionnaire was also pre-tested with 10 face to face interviews. We used the ISSP questionnaire for the demographic questions. There have been some optional questions included: V120-121, V124-125, V36, V133, V139, V217, V83-85, V97-102. There have been some country-specific questions included in the questionnaire but there have not been included before the demographic questions. The questions included were: b38-b42b45b46, b48-b61,b63-b80 were country-specific. Also, it is important to mention that not all the questions were in the prescribed order. The sample was not designed to be representative of the entire adult population. We excluded the non-urban population (communities that include less than 2000 people) which constitutes 9% of the Israeli population. The lower age cut-off for the sample was 18 and there was not any upper age cut-off for the sample.

Sample:

The sample was not designed to be representative of the entire adult population. We excluded the non-urban population (communities that include less than 2000 people) which constitutes 9% of the Israeli population. There were different stages in the sampling procedure: - Division into strata (based

on geographic location, community size and socio-economic characteristics). -With strata sampling of statistical areas (the smallest ecological unit). -Interviewing of specified number of persons within statistical units based on Kish-grid. Stratification factors were used such as: -Socio-economic characteristics of statistical area -Geographical region of statistical area

#### Remarks about sampling:

-Final numbers of clusters or sapling points: 47 -Sample unit from office sampling: Address point in the selection area, and the procedures for continued movement

#### Survey procedure:

Entrevista Personal

#### Fieldwork:

Interviewers were paid according to performance. The interviewer approach was through calls made at different times of day and calls made on different days of week. The minimum number of re-calls required were 3 and 33% of the interviews were back-checked.

#### Response rate:

The following table presents completion rate results: -Total number of starting names/addresses 3617 -Addresses established as empty, demolished or containing no private dwellings 241 -Selected Respondent had inadequate understanding of language of survey 278 -No contact at selected address 296 -No refusal at selected address 1367 -Other type of unproductive (please write in full details in the box below) 236 -Full productive interview 1199

#### Remarks about non-response:

-Cases were coded other when we could not determine whether the non-response was because of inappropriate address, no contact after 3 approaches or inappropriate respondent (mostly illegal workers).

#### Weighting:

No weighting variable was added.

Población Nacional, Ambos sexos, 18 y más años

Sample size:

1223

Estimated Error:

2,9

Questionnaire:

We used the questionnaire that was designed for the Islamic countries. The questionnaire was translated by a specialist translator. The translated questionnaire was back-translated into English and the translated questionnaire was also pre-tested: 133 questionnaires. There were some questions or concepts that caused particular problems when the questionnaire was translated in English. Especially the difficulties were in political matters. The question left-right scale was difficult for the respondent to understand. In fact the team decided to omit 26 questions from the original questionnaire, which were 237 questions. Thus we ended up using 211 questions. There were not included: Q73, Q83, Q90, Q94, Q168-174, Q183-186, Q187-190, Q202-203, Q206-209. The sample was designed to be representative of the entire adult population, i.e. 18 years and older, of your country. The lower age cut-off for the sample was 18 and there was not any upper age cut-off for the sample.

Sample:

There were different stages in the sampling procedure: 1- First stage is to draw primary sampling units (clusters) by pps method. 2- Second stage to draw households from each psu by systematic

method. 3- Third stage to draw the eligible person from each household by simple random sample. The quota sample is biased sample we dont use this type of samples in general. But we use stratified sample instead with implicit stratification if it is required, so for male and female from each cluster by drew 50% hh from each ssu for male and 50% for female. Substitution was permitted if the house become unoccupied or the nationality of the household is non-Jordanian. In the first stage stratification were applied for urban rural socio economic characters and administrative distribution.

#### Remarks about sampling:

-Final numbers of clusters or sapling points: 130 -Sample unit from office sampling: Household In each selected household the interviewers lists all male or female individuals above 18 and randomly according to a given table I which there is a family serial number one person is identified as a respondent. The extra samples of households were selected in advance before the field work start 3 independent households were selected from each cluster to subsidize non response.

#### Survey procedure:

Entrevista Personal

#### Fieldwork:

The fieldwork was done by the Centre for Strategic Studies at the University of Amman-Jordan. Interviewers were not paid according to performance. The interviewer approached was through calls made at different times of day. The minimum number of re-calls required were 2 and 1% of the interviews were back-checked.

#### Response rate:

The non response should be less than 5%

#### Weighting:

Yes The weighting is very important because the sample is not self-weighting design the weight equal the reverse of probability of drawing the sampling unit.

Sample:

Population: Total population of the Kyrgyz Republic, 18 years old and older. Five stage probability sampling. In the beginning the country is divided into eight strata. In each stratum the number of respondents is selected proportional to the size of population. 1) In each stratum 22 primary sampling units are randomly selected proportional to size. 2) In each primary sampling unit secondary sampling units (cities and villages) are randomly selected. 3) In each secondary sampling unit third sampling units (streets) are selected. 4) In each third sampling unit households are systematically selected. 5) In each household the respondent is randomly selected using the Kish-selection method. All adults (18 and older) are listed in a certain order first, males from the eldest to the youngest; second, females from the eldest to the youngest afterward, the respondent is selected by a selection key which is randomly composed for each possible type of household composition.

Survey procedure:

Entrevista Personal

Fieldwork:

Interviews were conducted by 50 well-trained interviewers who have taken special sessions for the

purposes of this research. 10 percent of the interviews were checked by follow-up visits to randomly selected respondents to ensure quality of fieldwork.

**Response rate:**

Response rate:  $(1,043/1420) \times 100 = 73.45\%$

**Questionnaire:**

The WVS questionnaire was translated from the English questionnaire by a member of the research team. The Mexican questionnaire for 2000 WVS was based on previous versions used in 1990 and 1995 in México. The translated questionnaire was back-translated into English and the translated questionnaire was also pre-tested in a pilot study. It was carried out 40 interviews, 30 of those administered in rural areas in order to check how language and visual cards worked. The other 10 interviews were conducted in urban areas according to our usual fieldwork requirements. The four states where the pilot study was carried out are located in the central part of the country. Some questions caused particular problems, rather than translation problems were the meaning of it: Variable V163 rates the political system as it was under the former regimes or 10 years ago, depending on the country. The Mexican translation referred to 10 years ago, when the PRI did not have any competition. There have been some country-specific questions included such as items on media exposure: v217 a to v217f; items on Mexico's economic ties with the United States: v222a to v222l and Party identification v222m to v222p. The sample was designed to be representative of the entire adult population, i.e. 18 years and older, of your country. The lower age cut-off for the sample

was 18 and there was an upper age cut-off for the sample 94 years. Some sampling points included indigenous communities. We did not administered interviews in a language other than Spanish. This may caused some selected respondents to decline the interview, since they did not speak Spanish but an indigenous language. This problem was minimal.

#### Sample:

It was followed a multi-stage sampling procedure. The first stage was the selection of polling points based on the list of electoral sections defined by the Federal Elections Institute. The sections were previously stratified as urban (70 percent) and rural (30 percent). Each section is relatively homogeneous in size, with about 800 registered voters in 63, 619 sections that cover all the countrys adult population. Respondents included, of course, also adults non registered as voters. We selected 155 electoral sections in a systematically random fashion in each stratum, based on the list arranged proportionally to size of population. In the second stage we selected the household with a systematic random selection, based on a standard strategy of walking around the housing districts selected in the sample. In the third stage, interviewers selected adult respondent in each household. Interviewers selected an adult using random selection method. Also control quotas according to age and gender in districts where random selection of interviewers was disproportionately leaning towards a specific group. The selected people was at least 18 years old, had to live in the household, and in middle-upper class districts the interviewers made sure that not domestic employees were interviewed. Interviews were not applied in business or offices, unless they were the same as the respondents home. Substitution was permitted. The interviewers were not able to get to it (the town of Juan N. Méndez in the state of Puebla) because of the absence of roads and transportation. It was substituted with a more accessible town (Olintla) with the same socioeconomic level, in the same region, state and electoral district. Substitution of households and respondents were also employed, in the case where either one of them was registered as a no contact or a refusal and remained under those categories after call backs or returns.

#### Remarks about sampling:

-Final numbers of clusters or sampling points: 155 -Sample unit from office sampling: Address.

#### Survey procedure:

Entrevista Personal

#### Fieldwork:

Interviewers were not paid according to performance. The interviewer approached was through calls made at different times of day and calls made on different days of week. The minimum number of re-calls required were 3. 60% of interviews were supervised and 60% of the interviews were back-checked.

#### Response rate:

The survey had a non-response rate of 34% (14% refusals, 19% no-contacts, and 1% incomplete interviews which were not included in the sample). Based on selection during fieldwork the sample

overrepresents the highest category of education, which tends to be common in México: more highly educated people are likely to respond survey questionnaires. The data were weighted by education according to census estimates prior to the 2000 census figures were released.

**Weighting:**

Yes A weighting variable based on education levels projected for year 2000 is included in the SPSS dataset

Sample size:

1060

Estimated Error:

3,1

Questionnaire:

The WVS questionnaire was translated from the English questionnaire by a specialist translator. The translated questionnaire was not back-translated into English and the translated questionnaire was not pre-tested. It was used the French version based on the V216. There have been some country-specific questions included such us V77 Roma instead of Jews V218 (SEE Codebook) V226: 1=2; 2=3; 3=4; 4=5; 5&6=7;7,8&9=8; 0.99=9 V243 (SEE Codebook) V245 (SEE Codebook).The sample was designed to be representative of the entire adult population, i.e. 18 years and older, of your country. The lower age cut-off for the sample was 18 and there was not any upper age cut-off for the sample.

Sample:

There were different stages in the sampling procedure:Three stages: Subsamples (regions), municipalities and local communities. Montenegro: Northern Montenegro, Central Montenegro and Southern Montenegro. In order to get the average data for Montenegro should be multiplied by 0.077 (0.08, rounded).In each subsample, municipalities were chosen on the basis of cumulative frequencies, using tables of random numbers. In Montenegro all 21 municipalities. Inside each municipality, local communities were chosen randomly (an election station as a survey point with 20 respondents). A systematic selection was applied from the voters registration lists, starting from a random beginning (person under No. 2) and taking each tenth voter. For each 20 respondents, the

plan ensured 20 reserves, chosen in the same way. Unfortunately, during conducting the field study an alternative procedure had to be used in 7% of points (each third house in the point, picking up a person having the closest birthday), because in eight points the registration lists were incomplete or unavailable. Otherwise, the interviewers were obliged to make at least three visits in order to find the persons selected from the lists in the sample points. Substitution was permitted. If three visits were done without success (also, if respondent was moved, permanently out of place, died, unknown or seriously ill), reserve was used (next number on the list of voters)

#### Remarks about sampling:

-Final numbers of clusters or sapling points: 53-Sample unit from office sampling: Named individual Election lists in local communities; Systematic choice, random beginning, each tenth citizen inside the last stage (local community)

#### Survey procedure:

Entrevista Personal

#### Fieldwork:

The fieldwork was conducted by 46 interviewers in Montenegro. The majority of them are B.A. psychologists (about two thirds), others are sociologists, social workers, political scientists, and specialized pedagogues. The interviewers observed the study, that is, the instrument as a very long and difficult for processing, but, at the same time, as very interesting, important and motivating for the interviewees. Control of interviewers' work consisted of three standard procedures: phone control of 10% cases, mail control of 20% cases (still not quite completed), and personal visits to 10% respondents. No indications of any serious irregularities were found until now. Interviewers were paid according to performance

#### Response rate:

Modalities of non-response in Montenegro-Reject to be interviewed 5.2%-Seriously ill and persons at hospitals 3.2%-Absent because of travel 5.7%-Moved to some other place, changed addresses 2.2%-Busy persons (work shifts, on board, etc) 3.4%-Died 0.2%-Unknown persons 0.4%-Other reasons 2.1% TOTAL 22.4%

#### Remarks about non-response:

Note: The percentages are expressed in relation to a number of respondents in the sample, that is, 1060 in Montenegro. Response rate based on formula:  $N/N + (R+I+B+T)$ , where: N = Number of accomplished interviews R = Number of refusals I = Number of ill people B = Number of busy people T = Number of people absent because of travel. Response rate Montenegro: 0.852

#### Weighting:

No weighting variable was added. All independent variables hit within the population parameters (with deviation less than SE, that is, 3%), except for the percentage of housewives in Montenegro (deviation of plus 5 percentage points). However, all these deviations of sampling measures do not

deserve applying any weighting procedure. Weighting procedure is needed only for expressing data for FRY

**Questionnaire:**

The survey used the standard WVS questionnaire instead of the more limited Islamic questionnaire. It was used the French questionnaire to make the WVS questionnaire. The WVS questionnaire was translated from the English questionnaire by a member of the research team. The translated questionnaire was also pre-tested. It was pretested in Casablanca with 10-15 persons of different age and status to test comprehension by respondents. Some of the questions on religion had to be eliminated because they caused some surprise, due to general agreement with one answer. A few other questions had to be eliminated because of lack of comprehension. The self anchoring scale of ideology was not well understood, but nevertheless was kept in. The following questions were eliminated from the questionnaire: 11-13-14-15-59-61-63-66-73-D15-D16-D17. Also some substitutions were made during the translation: In Q.15 Muslims was replaced by Trafiquants. In Q. 47 the Church was replaced by Religion. In Q. 47 the Arab League was added as an item. Besides, Church was always replaced by Mosque, and God was replaced by Allah. The sample was designed to be representative of the entire adult population, i.e. 18 years and older, of your country. The lower

age cut-off for the sample was 18 and there was not any upper age cut-off for the sample.

#### Sample:

In the sample, urban population was over-represented. The sampling stages were: regions-cities/villages-neighborhoods. The final selection was made using random routes. Selection of individual in households was made using sex and age quota. Substitution was made when there was nobody in household after four trials, or when there was a refusal, or there wasn't anybody eligible. Stratification factors were used by region and size of place. The only significant limitation was urban-rural distribution, and that has been corrected through weighting.

#### Remarks about sampling:

-Final numbers of clusters or sampling points: 30 -Sample unit from office sampling: Random routes-households quota by sex and age in household

#### Survey procedure:

Entrevista Personal

#### Fieldwork:

Interviewers were paid sometimes according to performance but not always. The interviewer approach was through calls made at different times of day. The minimum number of re-calls required were 4.

#### Remarks about non-response:

The number of full productive interview was 1247.

#### Weighting:

Yes Weighting was used to equilibrate sex-age and urban-rural distribution. Urban-rural distribution was more important with an under-representation of rural population. The weight is a matrix that combines the variables: sex, age and urban-rural distinction, and it is included in the data file

Questionnaire:

The WVS questionnaire was translated from the English questionnaire by a specialist translator. The translated questionnaire was also pre-tested. A pilot study was carried out in the 5 major languages used, that is, Pidgin, English, Hausa, Yoruba and Igbo languages. 50 pre-tests were carried out. The sample was designed to be representative of the entire adult population, i.e. 18 years and older, of your country. The lower age cut-off for the sample was 18 and there was not any upper age cut-off for the sample.

Sample:

There were different stages in the sampling procedure. Stage 1: Stratification of the country into 5 regions Lagos, West, East, North east and North west Stage 2: Lagos and F.C.T Abuja automatically selected while 5 states each are further randomly selected in each region. Each states allocation or quota was proportionate to its population figure in the country. Stage 3: With the aid of map, the states are further stratified into highly and lowly populated sectors to determine the primary sampling units Stage 4: Areas and streets visited in each sector were randomly selected Stage 5: The first dwelling structure or residential unit visited on each street was determined using the days code Stage 6: The final respondent interviewed in the household or dwelling structure was based on

the quota. 50% male, 50% female, age 18 year old and above, etc. A multi-stage sampling method was observed until the final respondent selection. The final respondent was quota by age and sex in all locations. There were some quota controls: -Only individuals who are 18 years old and above were contacted. -This is further broken down to age groups -18-24, 25-34, 35-44, 45-54, and 55+ - Also used on the sex of the respondents -50% males and 50% females The country was stratified into 5 mutually exclusive areas 1st stage and the sectors were stratified into highly populated and lowly populated sectors.

**Remarks about sampling:**

-Sample unit from office sampling: Household

**Survey procedure:**

Entrevista Personal

**Fieldwork:**

The fieldwork was done by RMS Media Services LTD. Interviewers were not paid according to performance. 40% of the interviews were supervised and 30% of the interviews were back-checked.

**Response rate:**

2,531 respondents were contacted out of which 2,022 calls were effective while 509 ineffective were ineffective. Details of the reasons for the ineffective calls are lost.

**Weighting:**

No weighting variable was added.

Sample size:

1055

Estimated Error:

3,1

Questionnaire:

From 28th November till 2nd December, BRIMA Skopje, joint venture with BBSS Gallup International, conducted survey of public opinion among Macedonian citizens. A nationally representative multi-stage random probability sample of the population aged 18+ was used for this survey. The sample design was drawn based on data as presented by the Republic Institute of Statistics (1994 census results) of the population aged 18 years and over, incorporating characteristics of the surveyed universe per age, gender, education, type of settlement, national affiliation and region.

Sample:

Sampling methodology and the sampling procedure was face-to-face interview, paper and pencil, in-home of the respondent. Selection of households was executed on random route principle *ibid.* in urban areas each third household on the left-hand side of the street, applying left turn at junctions and going back to the last crossing if one has reached a dead-end, further proceeding at random but not along the branching one had been through. In a block-of-flats, if it is a building with maximum four floors, the selected household is each fifth flat on the left, substitute being, in a cases of refusal, the next fifth flat, or in a cases of unsuitable household (for ex. Macedonian family when needed Albanian one) the next - door flat. In a block-of-flats of 5 floors and more, the selection is every tenth flat on the left with the same procedure for substitution - in cases of refusal the next tenth flat on the

left and in cases of unsuitable household the next door flat. In rural area, each fourth inhabitable house/dwelling on both sides of the route/track and where they are aligned or scattered over larger territory, wave-wise approach selecting the fourth, counting from the left. In compounds of several houses behind a common fence, the instruction rules to select the fourth from the left (counting from the gate), or if there are less than four houses behind a common fence than the interviewer to go out of the common yard counting the houses as if they were on the street. In compact and well-structured villages with negligible signs of destruction the selection procedure follows the instructions for urban areas. Selection of a respondent was carried out via "next birthday" selection key. The achieved sampling plan comprised of 161 sampling points 124 Macedonian and 37 Albanian, 4-8 respondents per unit in urban area and 4-8 respondents per unit in rural area, proportional to regional profile of different portions of the surveyed universe.

#### Remarks about sampling:

-Final numbers of clusters or sapling points:161-Sample unit from office sampling:Household

#### Survey procedure:

Entrevista Personal

#### Fieldwork:

A total of 70 interviewers were employed in the survey, of which 17 Albanians and 53 Macedonians. Of them 19 are males (15 Macedonians and 4 Albanians) and 51 females (38 Macedonians and 13 Albanians). 3 persons are on the age of 18, 24 interviewers between 19-25 years old, 19 persons between 26-30 years old, and 16 persons between 31-40 and 8 interviewers 41+ years old. Some of interviewers are students from different fields of studies, while the rest are graduated persons and with secondary school, some of them employed and some of them not employed. 86,2% of the interviews were made in the first visit, 12,8% in the second and 1% in the third visit. 9 supervisors and 2 persons from the management team have administered supervision, back-check control and quality editing of the questionnaires. 8 keypunchers accomplished the data-entry. The Data Processing manager and the Project manager in charge carried out first and second validation of the data.

#### Response rate:

Refusal rate stands at 241 cases. Regions with highest refusal rate are recorded to be Skopski - 94 and Pelagoniski - 50 refusals. Then: Povardarski - 17 refusals, Kumanovski - 12 refusals, Ohridski - 45 refusals, Poloski - 7 refusals and Bregalnicki - 16 refusals. Some said have no time, then offered another person to be interviewed, too busy, older people and women are scared to be interviewed when there is no man in the house. There are a number of refusals because some people do not believe in the anonymity of the interviews. The number of non-contacted persons is 72 36 in the Skopje region, 15 in the Pelagoniski region, 6 in Povardarski region, 8 in the Kumanovski region and 7 in the Bregalnicki region.

Universe:

Población Nacional, Ambos sexos, 21 y más años

Sample size:

2000

Estimated Error:

2,2

Questionnaire:

The WVS questionnaire was translated from the English questionnaire by a member of the research team. The translated questionnaire was then back-translated into English and also was pre-tested. There were no questions that caused problems when the questionnaire was translated. The questionnaire that was used to make the questionnaire was the Islamic Version of WVS questionnaire. A battery of questions regarding the September 11 events was included in the questionnaire. The question numbers are 140-155 in the questionnaire. However, no country-specific questions were included. The sample was designed to be representative of the entire adult population, i.e. 18 years and older, of your country. The lower age cut-off for the sample was 21 and there was not any upper age cut-off for the sample.

Sample:

The different stages in the sampling procedure were: At first stage, districts were selected randomly from all the four provinces. At next stage enumerated blocks of households and villages were selected randomly. The households were selected at third stage and finally the individual was selected at the final stage to be interviewed. The sampled unit we got from the office sampling was the household and the selection method that was used to identify a respondent was a list of all the available members of age 21 + and one was selected randomly. There were some quota-controls permitted and substitution was permitted as already was mentioned. In general, it has been used a

combination of purposive sampling, random sampling and quota sampling in four provinces in Pakistan. In addition to that, it has been used a clear rural-urban distinction. According to the latest figures, the rural population is about 50% of the total country population. So 50% of the sample has been drawn from rural areas. It included the same number of male and female respondents in the sample.

#### Remarks about sampling:

-Final numbers of clusters or sampling points: 2000 -Sample unit from office sampling: Household

#### Survey procedure:

Entrevista Personal

#### Fieldwork:

The interviewers were postgraduate students. All of them were familiar with the concepts and themes used in the WVS questionnaire and also because they were experts in interviewing people. All the team were given a very comprehensive training. The responsible person moved with them. In the evening they sit together and discuss any problems if there and also the field experience. The additional questions regarding September 11 events were particularly drawing attention of the respondents. People wanted to talk more. All the researchers have been told to quickly make notes of anything important when people talked. They also exchanged in the evening some comments and the responsible person took notes of all this and tried to go through all questionnaires (completed) on the same day or at the most the next day to ensure that all was OK and nothing was missing. This editing was done by the responsible. It also helped and guided in giving any instructions to the researchers if needed. The team of the fieldwork missed some areas. These were the areas adjacent to Afghan border. In fact some areas are under Army control or they are prohibited due to the presence of American troops there. So the team can not enter that area under any circumstances. Some other areas are having agitations. Some are tribal areas. The current situation was creating extra problems while moving in few parts of the country. It not only involves the extra cost but also involves some security issues as well. Interviews were done face to face. Interviewers were paid according to performance. Approximately 10% of the interviews were supervised. Approximately 5% of the interviews were back-checked.

#### Response rate:

A total number of starting names/addresses were done 2000. -Selected Respondent Refusal 25. - Proxy refusal (on behalf of selected respondent) 7 -Personal refusal by selected respondent 18 -Full productive interview

#### Weighting:

No weighting variable was added.

Questionnaire:

The WVS questionnaire was not translated or adapted from the English questionnaire. There have not been any country-specific questions included. Some core questions from the WVS were not included: Religious items especially the question related with the possibility of having a religious president. It was considered not relevant for Peru. The sample was designed to be representative of the entire adult population, i.e. 18 years and older, of your country. The lower age cut-off for the sample was 18 and there was not any upper age cut-off for the sample.

Sample:

We used a combination of random and probability sampling method. The sampling was distributed according to 5 regions: Gran Lima, North Centre, South and Orient. The interviews were distributed proportionately by province, districts, urban, semi urban and rural areas. Also the interviews were distributed by sex, age and socio-economic level. The sample unit we got from the office sampling was the household and the selection method that we used to identify a respondent was Kish.

Remarks about sampling:

-Final numbers of clusters or sampling points: 193 -Sample unit from office sampling: Household

Survey procedure:

## Entrevista Personal

### Fieldwork:

Interviewers were paid according to performance. The interviewer approach was through calls made at different times of day. The minimum number of re-calls required were 2 and 30% of the interviews were supervised and 30% were back-checked.

### Response rate:

The following table presents completion rate results: -Total number of starting names/addresses: 8155 -Selected respondent too sick/incapacitated to participate: 1564 -Selected respondent away during survey period: 1184 -No contact with selected person: 1732 -Personal refusal by selected respondent: 2070 -Full Productive Interview: 1501 -Partial Productive Interview: 1515

### Remarks about non-response:

There were some limitations in the sample. It was difficult to arrive at some rural areas. It was difficult to understand the questionnaire when the education level was low. It was a very long questionnaire especially for elderly people. Some people were not happy with religious items.

### Weighting:

No weighting variable was added.

Questionnaire:

The WVS questionnaire was translated from the English questionnaire. The translated questionnaire was back-translated into English and the translated questionnaire was also pre-tested. The 2001 WVS questionnaire was translated into 5 major Philippine languages. The Filipino version, which became the definitive version was first translated (from English) by a senior staff member of SWS. The final version was decided on by SWS staff members after pre-testing on 12 adults. The 4 other translations which used Filipino as basis and sometimes the English version were made by other non-SWS senior field staff members and were no longer reviewed by SWS. There have been some optional questions to the WVS: V181a-c. There have been some country-specific questions included asked at the end of the WVS demographics. The sample was designed to be representative of the entire adult population, i.e. 18 years and older, of your country. The lower age cut-off for the sample was 18 and there was not any upper age cut-off for the sample.

Sample:

The sampling methodology is dwelling-based. Thus, the homeless, the institutional residents - those residing in military barracks, convents, prisons, dormitories, evacuation/refugee centers or any other temporary dwellings such as those built inside school campuses, church compounds during disasters and those residing atop commercial buildings, are excluded from the frame. The selection method that was used to identify a respondent was random walk procedure. 50% males and 50% females

were used as quota controls by alternating between male and female respondents. Substitution was permitted if even after the required valid callbacks the respondent was not available; it was not giving accurate answers because bedridden; nobody was at home; a respondent outrightly refuses to be interviewed; respondent refuses to continue with the interview. Geographical stratification was: The WVS covered the entire Philippines and had four major study areas: National Capital Region (NCR), Balance Luzon (outside NCR), Visayas and Mindanao. There are usually limitations for the remote rural sample. The sample area was substituted if upon arrival in the sample spot the field interviewers realize that covering there were: - Not meeting the survey schedule because, for example, there were no means of transportation in locating the respondents with allotted schedule. -Security risks for field interviewers (presence of rebels, bandits, hostile ethnic minorities) -Spending too much for transportation (i.e unreasonably beyond the budgeted amount) Rural samples were generally within the center of the village as the starting points were situated near the center.

#### Remarks about sampling:

-Final numbers of clusters or sampling points: 240 -Sample unit from office sampling: Electoral precincts (for urban areas) and barangays or villages (for rural areas)

#### Survey procedure:

Entrevista Personal

#### Fieldwork:

For the National Capital Region (NCR), the field interviewers were paid a fixed fee for each completed interview. For areas outside of NCR, the field interviewers were paid the minimum wage plus per diems, and actual transportation fees and were given a minimum quota of 5 interviews per day. Even if the quota was not fulfilled but for justified reasons, these non-NCR interviewers were still paid the minimum wage plus the per diem. The interviewer approached was through calls made at different times of day and calls made on different days of week. The minimum number of re-calls required were 2 and 10% of the interviews were supervised and 20 % were back-checked.

#### Response rate:

For the WVS, 37% are original respondents; the rest are substitutes.

#### Weighting:

Yes Census-based population weights were applied to the survey data. The weight projection was computed by dividing the projected population in the area by the sample size of the same area.

## PUERTO RICO 2001

Geographical scope:

Puerto Rico

Principal investigator(s):

Jorge Benítez Nazario Department of Political Science University of Puerto Rico Río Piedras, 00931-3345 Puerto Rico F+ 809 763 5599

Fieldwork Period:

15-04-2001 - 15-05-2001.

Universe:

Población Nacional, Ambos sexos, 18 y más años

Sample size:

720

Estimated Error:

3,7

Questionnaire:

The WVS questionnaire was not translated from the English. There have not been any optional WVS questions and also country-specific questions were not included. The sample was designed to be representative of the entire adult population, i.e. 18 years and older, of your country. The lower age cut-off for the sample was 18 and there was not any upper age cut-off for the sample.

Sample:

We used a structured-random sample technique. We classified our universe (in the following ordered stages) according to geography (north, south, east, west, metropolitan area of SJ and central mountain region), cities, socio-economic status of neighbourhoods and households. The adult person in each household was selected according to Kish method. There were not clusters or sampling points. The sampled unit we got from the office sampling was the household and selection method that was used to identify a respondent was Kish grid, or the adult over 18 years old having the next birthdates. Stratification factors were used: Geography of the Island, Cities, and socioeconomic status. It is important to consider that we re-visited some households up to two more times.

Remarks about sampling:

-Final numbers of clusters or sampling points: No clusters -Sample unit from office sampling:  
Household

Survey procedure:  
Entrevista Personal

Fieldwork:

Interviews were done face to face. Interviewers were paid according to performance. Calls were made at different times of the day and in different days of week. The minimum number of re-calls required was 2. Approximately 35% of the interviews were supervised. Approximately 35% of the interviews were back-checked.

Response rate:

There were some limitations in the sample. We got 72 % response rate, which is considered good in politically oriented surveys in the Island. -Total number of starting names/addresses: 950 -Addresses which could not be traced at all: 47 -addresses established as empty, demolished or containing no private dwelling: 31 -There were selected respondent too sick/incapacitated to participate: 7 -There were selected respondent away during the survey period: 13 -No contact at selected address: 23 -No contact with selected person: 39 -Refusal at selected address: 40 -Proxy refusal (on behalf of selected respondent): n.a -Personal refusal by selected respondent: 40 -Full productivity interview: 752

Weighting:

No weighting variable was added.

**SAUDI ARABIA 2003**

Geographical scope:

Saudi Arabia

Data Collection Organization:

PAN ARAB RESEARCH CENTER

Fieldwork Period:

20-04-2003 - 10-05-2003.

Universe:

Población Nacional, Ambos sexos, 15 y más años

Sample size:

1502

Estimated Error:

2,6

Questionnaire:

The questionnaire was pre-tested with interviewers team and piloted. 15 pilots were conducted.

Variables: V38, V44, V45, V66 (2), V101 V106, V112, V116, V118, V119, V124, V128 V132, V148 (3), V160 V164 ,V167, V170, V183, V185 weren't asked because they are either not applicable for Saudi market or very sensitive to ask. The sample was designed to be representative of the entire adult population, i.e. 18 years and older, of your country. The lower age cut-off for the sample was 18 and there was not any upper age cut-off for the sample.

Sample:

Each City was divided into Administrative units. Each Administrative unit was divided in Clusters. Each Cluster was divided in Blocks. The interviewer received a map of the Cluster with the block to be surveyed specified. Sample per cluster was also specified. The interviewer at the beginning of the interviews asked the family member met to give him all household adults aged 15+, them the interviewer list all names of adults in the random selection table. In the first part of the questionnaire the interviewer draws 2 lines (vertical of household members & horizontal of questionnaire serial number. This intersection of these two lines identifies the no. of the person to be interviewed. In addition to the above, another two screening questions used to identify the respondent. Questions used to identify the respondents: Do you or anyone in your household or close relatives / or friends work for any of the following industries? -Advertising agency -Research agency -Media house / TV /

Radio / Publishing -Religious organizations -Government agencies Have you been interviewed by a market research agency in the last 6 months? If the respondent mentioned No in QA and No in QB only in this case he qualifies to be a respondent. Regional quotas were specified to respective field supervisors. Hand tallies were used to control the following factors Gender - Age Nationality.

Remarks about sampling:

Sampling by clusters

Survey procedure:

Entrevista Personal

Response rate:

Only refusals and incomplete interviews were the limiting factors to realizing the sample. -Addresses established as empty, demolished or containing no private dwellings: 117 -Selected respondent away during survey period: 150 -Refusal at selected address: 128 -Personal refusal by selected respondent: 180 -Full productive interview: 1502 -Partial productive interview: 60

Universe:

Población Nacional, Ambos sexos,18 y más años

Sample size:

1200

Estimated Error:

2,9

Questionnaire:

The WVS questionnaire was translated from the English questionnaire by a specialist translator. The translated questionnaire was not back-translated into English and the translated questionnaire was not pre-tested. It was used the French version based on the V216. There have been some country-specific questions included such us V77 Roma instead of Jews V218 (SEE Codebook) V226: 1=2; 2=3; 3=4; 4=5; 5&6=7; 7,8&9=8; 0.99=9 V243 (SEE Codebook) V245 (SEE Codebook).The sample was designed to be representative of the entire adult population, i.e. 18 years and older, of your country. The lower age cut-off for the sample was 18 and there was not any upper age cut-off for the sample.

Sample:

There were different stages in the sampling procedure:Three stages: Subsamples (regions), municipalities and local communities. The subsamples in Serbia were: Belgrade area, province of Voivodina and Central Serbia. In order to get the average data for Montenegro should be multiplied by 13 (12.97).In each subsample, municipalities were chosen on the basis of cumulative frequencies, using tables of random numbers. In Serbia, 60 municipalities were included (approximately one half). Inside each municipality, local communities were chosen randomly (an election station as a survey point with 20 respondents). A systematic selection was applied from the voters registration lists, starting from a random beginning (person under No. 2) and taking each tenth voter. For each 20

respondents, the plan ensured 20 reserves, chosen in the same way. Unfortunately, during conducting the field study an alternative procedure had to be used in 7% of points (each third house in the point, picking up a person having the closest birthday), because in eight points the registration lists were incomplete or unavailable. Otherwise, the interviewers were obliged to make at least three visits in order to find the persons selected from the lists in the sample points. Substitution was permitted. If three visits were done without success (also, if respondent was moved, permanently out of place, died, unknown or seriously ill), reserve was used (next number on the list of voters)

#### Remarks about sampling:

-Final numbers of clusters or sapling points: 60-Sample unit from office sampling: Named individual Election lists in local communities; Systematic choice, random beginning, each tenth citizen inside the last stage (local community)

#### Survey procedure:

Entrevista Personal

#### Fieldwork:

The fieldwork was conducted by 60 interviewers in Serbia. The majority of them are B.A. psychologists (about two thirds), others are sociologists, social workers, political scientists, and specialized pedagogues. The interviewers observed the study, that is, the instrument as a very long and difficult for processing, but, at the same time, as very interesting, important and motivating for the interviewees. Control of interviewers' work consisted of three standard procedures: phone control of 10% cases, mail control of 20% cases (still not quite completed), and personal visits to 10% respondents. No indications of any serious irregularities were found until now. Interviewers were paid according to performance

#### Response rate:

Modalities of non-response in Serbia-Reject to be interviewed 9.7%-Seriously ill and persons at hospitals 4.3%-Absent because of travel 6.4%-Moved to some other place, changed addresses 7.4%-Busy persons (work shifts, on board, etc) 9.0%-Died 1.4%-Unknown persons 5.4%-Other reasons 4.8%TOTAL 48.4%

#### Remarks about non-response:

Note: The percentages are expressed in relation to a number of respondents in the sample, that is, 1060 in Montenegro. Response rate based on formula:  $N/N + (R+I+B+T)$ , where: N = Number of accomplished interviews R = Number of refusals I = Number of ill people B = Number of busy people T = Number of people absent because of travel. Response rate Serbia: 0.773

#### Weighting:

Weighting procedure is needed only for expressing data for FRY

## SINGAPORE 2002

Geographical scope:

Singapore

Principal investigator(s):

Tan Ern Ser Department of Sociology National University of Singapore AS1 #03-10 11 Arts Link  
Singapore 117570 SINGAPORE soctanes@nus.edu.sg

Data Collection Organization:

Faculty of Arts and Social Sciences. National University of Singapore and Joshua Research Consultants

Fieldwork Period:

14-03-2002 - 07-08-2002.

Universe:

Población Nacional, Ambos sexos,15 y más años

Sample size:

1512

Estimated Error:

2,6

Questionnaire:

The questionnaire was translated by a specialist translator. It wasn't back translated to english but was pre-tested. The pre-test cases were selected to reflect as far as possible the profile of the population. One pre-test involving 39 cases. The following WVS questions were excluded: V12, V37-38, V137-140, V147-162, V163, V168-173, V177-181-190, V200-203, V220-222, V243 Reason(s) not included: Not applicable to the Singapore context. Some questions are politically sensitive. Moreover, the questionnaire was rather long, so most non-core questions were omitted, where possible.

Sample:

Stratified, random sample of Singapore citizens Lower age cutoff was set at 15. No clusters were used. Substitution was used when the person no longer lives in the address stated or when the case is not contactable after 3 tries. Sample was stratified by ethnicity at the sample design., and stratified by age after completion of fieldwork.

Remarks about sampling:

1. The majority group was undersampled, and minority ethnic groups oversampled, 2. The questionnaire was slightly modified; however, item numbering remains similar to the WVS master questionnaire.

Survey procedure:  
Entrevista Personal

Fieldwork:

Interviewers were paid according to performance. Calls were made at different times of day to approach address/household. Calls were made on different days of the week. Minimum number of recalls: 3 Interviews weren't supervised, but 305 of the interviews were back-checked.

Response rate:

%response is 79%, and %non-response is 21%. Total number of starting names/addresses: 2610 - Addresses which could not be traced at all: 183 - Addresses established as empty, demolished or containing no private dwellings: 26 - no contact with selected person: 341 - refusal at selected address: 379 - personal refusal by selected respondent: 379 - full productive interview: 1512 - partial productive interview: 21

Weighting:

For ethnicity, the weight factor was determined at the sample design stage; while that for age was determined after the fieldwork stage.

## SOUTH AFRICA 2001

Geographical scope:

South Africa

Principal investigator(s):

Mari Harris Markinor, POB 213 Pinegowrie 2123 Johannesburg South Africa T+27 11 462 3757 F+ 27 11 789 3764 E-mail: MariH@markinor.co.za Hennie Kotzé Dept. of Political Science University of Stellenbosch Private Bag X1 South Africa T+ 27 21 808 2107 F+ 27 21 8082110 E-mail: hjk@akad.sun.ac.za

Data Collection Organization:

Markinor(stellenbosch)

Fieldwork Period:

01-03-2001 - 22-05-2001.

Universe:

Población Nacional, Ambos sexos,16 y más años

Sample size:

3000

Estimated Error:

1,8

Questionnaire:

The WVS questionnaire was translated from the English questionnaire by a specialist translator. The translated questionnaire was pre-tested. The pre-tests were part of the general pilots. In total 20 pilots were conducted. The English questionnaire from the University of Michigan was used to make the WVS. Extra questions were added at the end of the questionnaire. Also, country specific questions were included at the end of the questionnaire, just before the demographics. The sample was designed to be representative of the entire adult population, i.e. 18 years and older, of your country. The lower age cut-off for the sample was 16 and there was not any upper age cut-off for the sample.

Sample:

The sample had to be representative of urban as well as rural populations. Roughly the distribution was as follows: -South Africa: 60% metropolitan (large cities with populations of 250 000+); 40% non-metropolitan (including cities, large towns, small towns, villages and rural areas). A standard form of sampling instructions was sent to each agency to ensure uniformity in the sampling procedure. Markinor stratified the samples for each country by region, sex and community size. To this end, statistics and figures that were supplied to us by the agencies were used. However, we requested the

agencies to revise these where necessary or where alternatives would be more effective. The agencies then supplied the street names for the urban starting points, and made suggestions for sampling procedures in rural areas where neither maps nor street names were available. From sample-point level, the respondent selection was done randomly according to a selection grid used by Markinor (the first two pages of the master questionnaire). Substitution was permitted after three unsuccessful calls. Six interviews were conducted at each sample point. The male/female split was 50/50. The urban sample included all community sizes greater than 500 and the rural sample all community sizes less than 500. This is the definition of urban and rural used in South Africa.

Remarks about sampling:

-Final numbers of clusters or sapling points: 500 -Sample unit from office sampling: Street Names

Survey procedure:

Entrevista Personal

Fieldwork:

Interviewers were paid according to performance. The interviewer approached was through calls made at different times of day and calls made on different days of week. The minimum number of re-calls required were 3 and 20% of the interviews were back-checked.

Weighting:

Yes Columns 749-754. Weighting statistics were based on the AMPS (All Media and Products Survey) 200 figures. The ultimate source of these figures is the South African General Population Census, 1997. The data are kept by Statistics South Africa.

## SOUTH KOREA 2001

Geographical scope:

South Korea

Principal investigator(s):

Universe:

Población Nacional, Ambos sexos, 18 y más años

Sample size:

1200

Estimated Error:

2,9

Questionnaire:

The WVS questionnaire was translated from the English questionnaire by a member of the research team. The translated questionnaire was not back-translated into English; and was not pre-tested. There have not been any optional WVS questions and/or items been included, however country-specific questions were included at the end of the questionnaire, just before the demographics. All questions asked were in the prescribed order. Nevertheless, a number of questions were omitted because they were not relevant to Korean situations: V53, V67, V160-161, V176, V191-195, V204, V218-222, V227-228, V235, V237-244. The sample was designed to be representative of the entire adult population, i.e. 18 years and older, of your country. The lower age cut-off for the sample was 20 and there was not any upper age cut-off for the sample.

Sample:

The different stages in the sampling procedure were: Our survey design called for interviews with a sample of n= 1,200 adults who were 20 years and older, living in private dwelling units. The sample was to be taken as selection of 120 clusters with a sample of 10 chosen from the household of each of the selected clusters. The final numbers of clusters or sampling points were 120. The sample unit got from the office sampling was the household. The selection method used was: -First, it was obtained 120 clusters (town or villages) though probabilities Proportional to Size Measure (PPS). - Second, two smaller blocks were selected from each cluster. -Third, 5 households were selected

within one smaller block by an appointed procedure. -Fourth, the interviewers called at selected households and interviewed with the person whose birthday was earliest among the family members were 20 years and older. Substitution was permitted if selected sample areas were non-residential or commercial quarters it was allowed to select contiguous residential quarter.

**Remarks about sampling:**

-Final numbers of clusters or sampling points: 120 -Sample unit from office sampling: Household

**Survey procedure:**

Entrevista Personal

**Fieldwork:**

Interviewers were paid according to performance. The interviews were not supervised and were not back-checked.

**Response rate:**

There were some limitations of the realised sample. It was not measure non-response rates. In sample design, we did not include islands into primary sampling area, because of survey costs.

**Weighting:**

Yes On the basis of age and schooling distributions of target population (2000 Korean Census data), the observations were weighted. Age and schooling distribution were divided into five groups: 20-29, 30-39, 40-49, 50-59 and 60 years and older. Schooling group: primary school, middle school, high school, university-level education without degree, university level education with degree and over.

Data Collection Organization:

Análisis Sociológicos, Económicos y Políticos and Intercampo (Madrid)

Fieldwork Period:

06-11-2000 - 13-11-2000.

Universe:

Población Española, Ambos sexos, 18 y más años

Sample size:

1209

Estimated Error:

2

Questionnaire:

The English official version WVS questionnaire was used.

Sample:

1) Interviewees were distributed proportionally to population in each of the 17 Autonomous Communities (Regions). 2) Interviews were then distributed, within each region, by size-categories of municipalities population. 3) Municipalities are randomly selected within each region and size category. 4) Census regions are randomly selected within each municipality. 5) Random routes are used within each census section to select building. 6) Stages and/or households are randomly selected within each building. 7) Kish tables are used to select individual within each household. The final number of clusters was 131. Lower age cut-off was set at 18 years.

Remarks about sampling:

Substitution was permitted after 3-4 attempts to find at home the selected individual or after a definite refusal. All substitutions are selected within the same census section (which is the smallest census unit). The substitution rate is high, a growing problem for every institute doing face-to-face interviewing at R's home. However, the demographic profile (even cross-tabs) of each sample is similar in all of our studies and similar to census data. Stratification factors used were: Region (17) and Size of Municipality (7 categories). Proportional distribution of interviews to population 18 years and over in both cases was then used.

**Survey procedure:**  
Entrevista Personal

**Fieldwork:**

The interviewers were paid according to their performance and 33% of them was supervised. Concerning the rules that were governed how an interviewer approached an individual, address or household, calls had to be made at different times of the day. There was a minimum number of 4 recalls before interviewers were allowed to stop trying to contact respondents. El 30% of all interviews eventually was back-checked.

**Response rate:**

There were some limitations in the sample. The substitution rate is high, a growing problem for every institute doing face-to-face interviewing at R's home. However, the demographic profile (even cross-tabs) of each sample is similar in all of our studies and similar to census data. -There were selected respondent too sick/incapacitated to participate: 3 -There were selected respondent away during the survey period: 10 -No contact at selected address: 25 -No contact with selected person: 15 -Proxy refusal (on behalf of selected respondent): 10 -Personal refusal by selected respondent: 15 -Full productivity interview: 1209

**Weighting:**

The data file is provided unweighted, but a weight variable is included in case someone needs it. The weight variable is a 2 x 4 matrix (age and sex) and it may be used to make sure the sex-age distribution of the sample is exactly the same as that of the Spanish population 18 years and over. However, the differences between the weighted and the unweighted samples are very small, due to our sampling process.

**SWEDEN 1999**

Geographical scope:

Sweden

Principal investigator(s):

Prof.dr. Thorleif Pettersson University of Uppsala Faculty of Theology Sociology of Religion PO Box 1604 Uppsala 75146 Sweden P +46 (18) 18 21 71 F +46 (18) 71 01 70 E-mail: thorleif.pettersson@teol.uu.se

Data Collection Organization:

ARS - Research AB

Fieldwork Period:

15-11-1999 - 13-02-2000.

Universe:

Población Nacional, Ambos sexos,18 y más años

Sample size:

1015

Estimated Error:

3,1

Questionnaire:

The questionnaire was translated and/or adapted from the English Master Questionnaire (the Danish questionnaire was used to construct the Swedish version). This translation was carried out by a member of the research team. The questionnaire was then back-translated into English and pre-tested (pre-testing was done by the interview organiser (mainly to check time and discover 'bad' questions)). There have been a number of optional EVS questions and items included in the Swedish questionnaire. These are: q20a, q57a, q58\_k and q58aq110a. Beside these, there were also country specific questions and items included that were neither compulsory nor optional EVS questions. These country-specifics included several items from the WVS-questionnaire. There were located in the combined EVS-WVS questionnaire. Concerning the order of questions, they were all ordered in the prescribed order. Not all core EVS (demographic) questions were included in the Swedish questionnaire. Items that were not included are: q26, q36, q45\_a, q69, q82, q83, q97, q98, q99, q100, q101, q104, q107, q111: economic reasons.

Sample:

Two-stage sample: 1. Municipalities/regions, 2. Respondents.

Remarks about sampling:

The final number of clusters or sampling points is 51. The sampled unit from office sampling is the named individual. A known limitation of the realized sample is the slight geographical bias in the sample.

**Survey procedure:**

Entrevista Personal

**Fieldwork:**

The interviewers were paid by hours worked. Concerning the rules that were governed how an interviewer approached an individual, address or household, calls had to be made at different times of the day and on different times of the week. There was a minimum number of 6 recalls before interviewers were allowed to stop trying to contact respondents. 20% of all interviews eventually was back-checked.

**Response rate:**

41% Concerning non-response the following reasons were given: the total number of starting names/addresses was 2500; there were 625 cases in which addresses couldn't be traced at all or where addresses were established as empty, demolished or containing no private dwellings; for 585 times it was the case that the selected respondent was too sick/incapacitated to participate, the selected respondent was away during the survey period, the selected respondent had an inadequate understanding of the language of survey, there was no contact at the selected address, there was no contact with the selected person, there was a refusal at the selected address, there was a proxy refusal (on behalf of the respondent), there was a personal refusal by the selected respondent, or there was another reason (which are not specified here); for 1015 cases there was a full productive interview.

**Weighting:**

Because of a geographical bias, a weightvariable is included.

**TANZANIA 2001****Geographical scope:**

Tanzania

**Questionnaire:**

The questionnaire used for Tanzania for the WVS 2001 was the one downloaded from the website titled 1999-2000 World Values Survey Questionnaire, and adapted to the Tanzania operational environment. The WVS questionnaire was translated from the English questionnaire by a member of the research team. The translated questionnaire was not back-translated into English but it was pre-tested. There were some questions that caused problems when the questionnaire was translated especially questions related to: - Happiness because there are different perceptions about it. - Homosexuality was rejected because cause apathy. -Left-right (in politics) not clear in our society. - Income levels- definition. -Class categories because it is not easily understood in places other than urban areas. These problems were solved looking for closest equivalents and it was carefully explained. No country-specific questions were included. A number of questions were omitted because they sounded totally irrelevant for the local population or because previous surveys indicated that they did not work for this population: -For instance, the Ethnic group question was considered irrelevant because officially when one asks for ethnic identity in Tanzania the respondent seems to be evasive because it is negatively associated with tribalism favouring ones narrow/selfish interests and nepotism. Therefore responses would not be categorical and true. -The Region where the interview was conducted. This question was discarded because the Tanzania survey covers the

entire country by sampling out representative districts and respondents by the use of a Table of Random numbers. -Some concepts in the English version could hardly find a relevant equivalent (without distortions) in the language of the interview (Kiswahili). These were therefore omitted. These include some variables: Emotionally unstable people. -Some concepts were irrelevant in Tanzania: e.g. Jews. This category is difficult to identify in Tanzania as it has people too few to be bothered about. This category was however substituted with Christians and Witchdoctors and related labels. -The category known as European Union is irrelevant to Tanzania. The question was adopted and substituted with East African Cooperation. The sample was designed to be representative of the entire adult population, i.e. 18 years and older, of your country. The lower age cut-off for the sample was 18 and there was not any upper age cut-off for the sample.

#### Sample:

The different stages in the sampling procedure were: -Creation of sample frames of regions districts, wards and cleaned - Creation of sample frames at ward/village level and cleaned -Application of table random numbers to pick respondents -Proportionate-stratified random sampling procedures applied - Face to face questionnaire filling was then done -Each respondent unit was cleaned/edited or clarity done by a supervisor The sampled unit we got from the office sampling was the household combined with named individual and the selection method that was application of table random numbers to locate households obtained at ward (urban areas), village (rural areas) and individuals at office/factories. There were not any quota controls. Substitution was permitted in households: if husband or wife not found in house at times of visit, interview eldest household member beyond 18 years and also substitution was permitted if too many men/women picked, purposively pick more of the opposite sex. The stratification factor that was used: Selecting regions according to income levels (per capita), ethnic concentration, educational levels, Islam vs. Christian areas all to ensure adequate representation.

#### Remarks about sampling:

-Final numbers of clusters or sapling points: No clusters -Sample unit from office sampling:  
Household combined with Named Individual

#### Survey procedure:

Entrevista Personal

#### Fieldwork:

Interviews were done face to face. The interview language was the Tanzanian linguafranca namely Kiswahili. The reason for the decision was that Kiswahili is spoken by about 90% of the Tanzania population, it is the official language here, and it carries relevant conceptualisation of values content relevant to Tanzania. Interviewers were not paid according to performance. Approximately 70% of the interviews were supervised. Approximately 90% of the interviews were back-checked.

#### Response rate:

There were some limitations in the sample. The average rate of responses was between 3% and

15% depending on education and occupation types. Also the people in employment had little time and we had to do interviews during the night in some towns.

**Weighting:**

No weighting variable was added.

Questionnaire:

The WVS questionnaire was translated from the English questionnaire by a member of the research team. The translated questionnaire was not back-translated into English and also was pre-tested. There were some questions that caused problems when the questionnaire was translated especially questions assuming a church organisation were problematic. Also some of the irrelevant questions were omitted; some were asked nevertheless. There have not been any optional WVS questions and/or items been included, however country-specific questions were included. They were mostly included at the end of the questionnaire but some country specific additions were made to a confidence in institutions and b) neighbours questions. A number of questions were omitted because they sounded totally irrelevant for the local population or because previous surveys indicated that they did not work for this population. The sample was designed to be representative of the entire adult population, i.e. 18 years and older, of your country. The lower age cut-off for the sample was 18 and there was not any upper age cut-off for the sample.

Sample:

The different stages in the sampling procedure were: -Self representative PSU's (provinces) - Selected provinces (PPS selection with implied stratification according to income) -Districts within provinces -Urban and rural locations within districts (villages selected PPS within rural areas; neighbourhoods and streets selected within urban locations, households identified with systematic

random selection, Age and gender quotas used in the final selection of individuals) The final numbers of clusters or sampling points were 22 PSU's. The sampled unit we got from the office sampling was the address and the selection method that was used to identify a respondent was move on the next address until quota is filled. The quota control was 3 age groups and 2 gender groups were used as quotas. The stratification factors that was used: Per capita gdp. There were some limitations in the sample. It was a quota sample in the last stage as explained above. Overall, the design yields very satisfactory results.

#### Remarks about sampling:

3 age groups (18-27; 28-40; 41+) and 2 gender groups were used as quota controls. There were stratification factors per capita gdp. A known limitation of the realized sample: this was a quota sample in the last stage as explained. Overall, the design yields very satisfactory results

#### Survey procedure:

Entrevista Personal

#### Fieldwork:

The interviewers were paid according to their performance and 10% of them was supervised. There were no rules concerning the way how an interviewer approached an individual, address or household. 25% of all interviews eventually was back-checked.

Questionnaire:

The WVS questionnaire was translated from the English questionnaire by a specialist translator. The translated questionnaire was pre-tested. The pre-tests were part of the general pilots. In total 20 pilots were conducted. The English questionnaire from the University of Michigan was used for make the WVS. Extra questions were added at the end of the questionnaire. Also, country specific questions were included at the end of the questionnaire, just before the demographics. The sample was designed to be representative of the entire adult population, i.e. 18 years and older, of the country. The lower age cut-off for the sample was 18 and there was not any upper age cut-off for the sample.

Sample:

The interviews were allocated to both the rural and urban sample. For each of these there is a male and female split and a total sample. The total sample is split up between actual amount of interviews and the number of sampling points per province. For the Lira province, 36 interviews must be conducted in rural areas in total, which means that 6 sample points need to be drawn for rural Lira. The sample had to be representative of urban as well as rural populations. Roughly the distribution was as follows: Uganda: 30% urban; 70% rural. A standard form of sampling instructions was sent to each agency to ensure uniformity in the sampling procedure. Markinor stratified the samples for each country by region, sex and community size. To this end, statistics and figures that were supplied to us

by the agencies were used. However, we requested the agencies to revise these where necessary or where alternatives would be more effective. The agencies then supplied the street names for the urban starting points, and made suggestions for sampling procedures in rural areas where neither maps nor street names were available. From sample-point level, the respondent selection was done randomly according to a selection grid used by Markinor (the first two pages of the master questionnaire). Substitution was permitted after three unsuccessful calls. Six interviews were conducted at each sample point. The male/female split was 50/50.

#### Remarks about sampling:

Selecting de rural points: Due to the fact that there is so many rural points, we use the method of selecting smalls towns and then conducting the interviews within a 20km radius of the boundaries of the selected town.

#### Survey procedure:

Entrevista Personal

#### Fieldwork:

The agency contracted to do the fieldwork in Uganda went to considerable ends to fulfil the stringent sampling requirements. Fieldwork took place before and after the much-published Uganda presidential election. The election was held on 12 March 2001. On Wednesday 4 March the research team narrowly escaped a rebel attack at Kasese (Western Uganda). In the northern district of Lira and Apac, where rebel activities are prevalent, the team had to seek for the necessary security cover from the military personnel to enable then to conduct the survey at the selected points. The poor road network in the north and north-western districts and Masindi slowed down the fieldwork.

#### Weighting:

Yes Columns 849-854. The statistics for Uganda were supplied by the Uganda National Council for Science and Technology.

**Questionnaire:**

The WVS questionnaire was the English questionnaire. There have been some country-specific questions included, just before the end of the questionnaire. The sample was designed to be representative of the entire adult population, i.e. 18 years and older, of your country. The lower age cut-off for the sample was 18 and there was not any upper age cut-off for the sample.

**Sample:**

Interviews were conducted with a representative sample of 1,200 adults, ages 18 and older. In the first wave no maximums were established. In the second wave no more than 7 males or females were allowed per sampling point. The sample was derived by producing 100 randomly generated sampling points from around the United States. Each sampling point was identified by a zip code. Interviewing facilities within a reasonable distance of each sampling point were identified and lists of residential telephone numbers within a 15-mile radius of the facility were randomly generated. In five cases, due to geographic obstacles, the radius was reduced to 5 miles to facilitate recruiting. This was the case in the sampling points #15, 54, 70, 84 and 86. In seven cases where the randomly generated sampling point was in a remote location or access was too expensive, it was substituted to a close by and similar place where access to respondents was feasible. This was the case in the sampling points # 47, 80, 82, 91, 94, 95 and 99. Sampling points 73 and 98, which are 53 miles apart, were being handled by the same research facility. The same zip code was used to generate sample for

both points. Telephone pre-recruit to a central location for in-person interview, approximately 45 minutes in duration. Cash incentive offered of between \$30 and \$45. Twelve interviews were required for each of the 100 sampling points for a total of 1,200 completed interviews. A birthday screen was utilized, targeting the adult in the household who had the most recent birthday. A minimum of three callback attempts were made on each number. In the first wave 120 telephone numbers were supplied for each sampling point. When sample was exhausted, the last digit of each phone number was replaced with a randomized digit to generate more samples. In the second wave a minimum of 240 telephone numbers was supplied for each sampling point, provided in batches of 120. Each batch was worked in its entirety before the next batch was released.

#### Remarks about sampling:

-Final numbers of clusters or sampling points: 100 -Sample unit from office sampling: Household A next birthday selection mechanism was used to identify the respondent.

#### Survey procedure:

Entrevista Personal

#### Fieldwork:

Fieldwork was done in two waves of 600 interviews per wave because of financial reasons. Recruiting and interviewing for the first wave began on 19 November 1999 and concluded on 23 December 1999. The second wave began on 4 August 2000 with the majority of data collection completed by 6 September 2000. The last interview was completed on 25 September 2000. The interviewer approached was through calls made at different times of day and calls made on different days of week. The minimum number of re-calls required was 3.

#### Weighting:

Yes Weighting schemes were applied.

Questionnaire:

There was a pre-survey preparation: the English questionnaire was translated into Vietnamese. Survey leaders repeatedly reviewed and edited the translated version before finalised Vietnamese version. The questionnaire was pre-tested. Each member of the team tried to answer all the questions in the questionnaire. If any difficult appeared, the team did make change. There have not been any optional WVS questions and/or items been included, however country-specific questions were included at the end of the questionnaire, just before demographics: -139a People are talking about continue the reform. You are for or against reform. -215a You are considered yourselves as (1) Northern Vietnamese; (2) Southern Vietnamese; (3) Vietnamese only Some core questions from the WVS were not included such as: V220; V221; V222. The reason was because there is a single party system in this country. The sample was designed to be representative of the entire adult population, i.e. 18 years and older, of your country. The lower age cut-off for the sample was 18 and there was not any upper age cut-off for the sample.

Sample:

The different stages in the sampling procedure were: -Selecting Provinces in each region -Selecting districts in each selected province -Selecting spots in each selected district The sampled unit we got was the household and the selection method to identify a respondent was the random walk. There

were not quota-controls and the stratification factor that we used was sample selected depending on Population at all stages. The household was chosen to be the primary sampling unit. Vietnam was divided into 8 following regions: Red River Delta, North East, North West, South Central Coast, Central Highlands, South East, Mekong Delta. The questionnaires were allocated based on the proportion in population. Define sample provinces were based on probability sampling. It was chosen 5 sample households in each village using a random walk procedure. The identification of the respondents was done after already selecting the household, list all 18 years old and above family members using a selection table key.

#### Remarks about sampling:

-Final numbers of clusters or sapling points: No clusters -Sample unit from office sampling: Random walk

#### Survey procedure:

Entrevista Personal

#### Fieldwork:

The field quality control was done with 1 field coordinator for each region who observes at least 20% of the total output of the field interviewer. Field coordinators do spot checking or back-checking. Field interviewers do field editing. The training course was held at Vietnam Institute of Human Studies from Sep/30th /01 to August/3rd/01. The content was to learn basic information about the project; learn rules of selecting household, identifying respondent, substitution rules, interviewing techniques and do mock interviews with colleagues. Interviewers were paid according to performance. Calls were made at different times of the day and the minimum number of re-calls required was 3. Approximately 50% of the interviews were supervised. Approximately 20% of the interviews were back-checked.

#### Response rate:

There were some limitations when we realised the sample such as a rate of 83% responses against 17% not responses. We received 1000 completed questionnaires out of 1300 asked questionnaires.

#### Weighting:

No weighting variable was added

**V36-** Here are two statements people sometimes make when discussing the environment and economic growth. Which of them comes closer to your own point of view? A. Protecting the environment should be given priority, even if it causes slower economic growth and some loss of jobs B. Economic growth and creating jobs should be the top priority, even if the environment suffers to some extent

**V82-** Some people feel they have completely free choice and control over their lives, while other people feel that what they do has no real effect on what happens to them. Please use this scale where 1 means "none at all" and 10 means "a great deal" to indicate how much freedom of choice and control you feel you have over the way your life turns out.

TOTAL	How much freedom of choice and control											Base mean	
	None at all	2	3	4	5	6	7	8	9	A great deal	Don't know	No answer

**V103-** Imagine two secretaries, of the same age, doing practically the same job. One finds out that the other earns considerably more than she does. The better paid secretary, however, is quicker, more efficient and more reliable at her job. In your opinion, is it fair or not fair that one secretary is paid more than the other?

TOTAL	Fairness: One secretary is paid more

**V145-** Now I'd like you to tell me your views on various issues. How would you place your views on this scale? 1 means you agree completely with the statement on the left; 10 means you agree completely with the statement on the right; and if your views fall somewhere in between, you can choose any number in between. Sentences:

TOTAL	Ideas that stood test of time are generally best	New and old ideas									New ideas are generally better than old ones	Don't know	No answer	Base mean

**V177-** Some people believe that certain kinds of problems could be better handled by the United Nations than by the various national governments. Others think that these problems should be left entirely to the respective national governments; while others think they would be handled best by the national governments working together with co-ordination by the United Nations. I'm going to mention some problems. For each one, would you tell me whether you think that policies in this area should be decided by the national governments, by the United Nations, or by the national governments with UN co-ordination?
